Streamlining Ticket Assignment for Efficient Support Operations

7. PROJECT DEMONSTRATION

Introduction

Support teams in organizations handle a large number of service requests and incident tickets every day. Manually assigning tickets to support agents can lead to delays, errors, and inefficient workflow. To overcome these challenges, an automated ticket assignment system can be implemented using ServiceNow. This project focuses on streamlining the ticket assignment process by automatically allocating tickets to the appropriate support teams based on predefined rules such as department, issue type, or priority.

Objective

- To automate the ticket assignment process.
- To reduce manual effort in managing support requests.
- To ensure faster response time for incident resolution.
- To improve efficiency in support operations.
- To maintain organized and accurate ticket management.

Modules

1. Ticket Data Creation Module – Creating ticket records using Excel or Google Sheets.
2. Data Import Module – Importing ticket data into the ServiceNow platform using Import Sets.
3. Transform Map Module – Mapping imported ticket fields to the Incident table.
4. Ticket Assignment Module – Automatically assigning tickets using assignment rules.
5. Incident Management Module – Viewing and managing assigned tickets through the Incident form.

Project Demonstration

Step 1: Creating Ticket Data
Create a dataset containing ticket details such as ticket number, issue description, priority, department, assigned team, and status. Save the file in CSV or Excel format.

Step 2: Importing Ticket Data
Open the ServiceNow developer platform. Navigate to System Import Sets → Load Data and upload the ticket data file. Create an Import Table and verify that the records are successfully imported.

Step 3: Creating Transform Map
Navigate to System Import Sets → Transform Maps. Create a new transform map and select the

source table and the target table (Incident table). Map the fields using auto match and mapping assist.

Step 4: Transforming the Data
Run the transform process to move the data from the import table to the Incident table and verify that the ticket records are created successfully.

Step 5: Automatic Ticket Assignment
Configure assignment rules based on conditions such as priority, department, or issue type so that the system automatically assigns tickets to the appropriate support team.

Conclusion

The Streamlining Ticket Assignment project demonstrates how automation can improve support operations. By implementing automated ticket assignment in ServiceNow, organizations can reduce manual workload, improve response time, and ensure that tickets are handled by the appropriate support teams efficiently. This system helps in maintaining a structured workflow and enhances overall service management performance.
